Conclusions

Based on our dataset, the report was able to generate findings through the data frame info. By showing the unique ratings, the report deduced the number of food trucks which had ratings above 4.0. These data did show high enough ratings to suggest how good their cuisines are. While these can be deduced from the ratings, several factors which may not have been taken into account could affect the ratings such as number of real ratings, how many individual ratings were there compared with how may patronized these food trucks.
